

SentinelOS Executive Snapshot - 2026-05-15

COMM: Sentinel AI by Cody Nunn | Nunn Cloud

Artifact Decision

[KEEP:CURRENT-DAILY-EXECUTIVE-SNAPSHOT]

Next step: use this as the May 15 executive operating snapshot until a newer daily snapshot supersedes it.

Executive Result

SentinelOS is in a hardening and infrastructure-consolidation posture, not an expansion posture.

The current working position is:

SentinelOS Deal Execution Engine
No drift.
Governed execution continuity before new surface expansion.

The system pieces are coming together as a governed execution stack:

Surface / demo route

- > API and command envelope
- > identity, scope, and governance preflight
- > signed execution context
- > approval boundary
- > command handler / control plane intent
- > audit receipt
- > Governance Signals / metrics / escalation posture
- > documentation, runbook, and pilot packaging

Today's Operator Snapshot

Area	Status	Evidence
Executive alignment	current	<code>pnpm run command:executive-alignment</code> executed <code>repo.update.structure</code> , scanned 109 docs, and wrote May 15 alignment artifacts
Execution integrity	healthy	<code>pnpm run check:execution-integrity</code> passed for <code>application.submit</code> through the Sentinel execution path
Policy engine	healthy	<code>pnpm run check:policy</code> passed
Approval bottleneck analysis	healthy	<code>pnpm run check:approval-bottleneck</code> passed through governed command execution
FacePlane fork continuity	healthy	<code>pnpm run check:faceplane-fork-continuity</code> passed across ownerfi, hotelops, and itad
Public backend bridge	healthy	<code>https://nunncorporation.com/api/status</code> returned <code>status: connected</code> with backend <code>status: ok</code> , <code>mode: non-demo</code> , <code>tier: PUBLIC</code> , and database enabled
Direct raw Azure health check	not revalidated in this turn	sandbox DNS failed first; escalated direct Azure curl approval was denied. Use the public status bridge as current evidence, not a direct Azure-host claim

Current System Position

SentinelOS is no longer just a proof UI or command router. It now has the components needed to operate as governed infrastructure:

- API service and public surfaces are present in `apps/api/server.js` and `apps/api/public/`.
- `/v1/command` remains the primary governed command boundary.
- Command dispatch stays inside the existing CommonJS surface model through `apps/sentinel/src/commands/dispatch.js` and surface registries.

- Policy, preflight, signed context, audit, and approval behavior are all active in the execution path.
- Governance Signals, metrics, and readiness posture are documented as the live control-loop layer.
- Mock FacePlane governance simulation, telemetry persistence, and cross-run analytics are verified for Phase 1.1.
- Archive Intelligence and Forethought Interpretation remain observe/classify layers; they do not execute.

Infrastructure Review

1. Runtime Hosting

Current runtime is Azure Container Apps centered on:

```
ca-nc-dev-sentinel  
acrncdevsentinel  
eastus2  
Log Analytics workspace: log-nc-dev-sentinel
```

The live bridge at `nunncorporation.com/api/status` currently reports a connected non-demo backend with database enabled. This confirms the public surface is reaching the Sentinel backend.

Infrastructure note: `docs/DEPLOYMENT.md` describes port `80` as the live runtime target, while `azure/container-app.yaml` still shows template placeholders and `targetPort: 3000`. Treat the YAML as a scaffold/reference file until reconciled with the actual live Container App configuration.

2. Application/API Layer

The API layer is converging around a single rule:

```
No governed action outside the command/control path.
```

Current active pieces:

- `apps/api/server.js`: HTTP routes, public UI, health/status, command ingress.
- `POST /v1/command`: primary governed execution route.

- `POST /command`: compatibility path.
- `/approvals`: approval read/review boundary.
- `/v1/audit`, `/v1/audit/stream`, `/v1/signals/stream`, `/v1/metrics`: audit, signal, and operational visibility.
- `/ready`: readiness contract including signal-store posture.

3. Policy And Governance Layer

Current governance layer is assembled around:

- API key and principal resolution.
- Role/scope enforcement.
- Governance preflight.
- Signed execution passport / decision integrity.
- Approval-required stops that return visible block states.
- Audit events for successful and blocked paths.

Today's local checks confirm the policy engine, execution integrity path, approval bottleneck analysis, and FacePlane fork continuity remain operational.

4. Data, Audit, And Signals

Current data posture:

- PostgreSQL is enabled on the live backend per public status response.
- Persistent approvals and audit-backed execution records are part of the current architecture.
- Governance Signals are designed to persist through DB when available, with JSONL fallback for local/non-database contexts.
- Mock governance run artifacts persist under `runtime/mock-results/`.

Phase 1.1 evidence shows cross-run analytics can load historical artifacts and produce aggregate governance metrics.

5. Surface Planes And Demo Package

Current buyer-facing proof should remain the governed deal execution loop:

```
submit deal
-> block execution
-> show why
```

```
-> score / signal
-> approve
-> execute
-> activity and audit
```

Surface expansion should stay frozen unless explicitly approved. Existing OwnerFi, hotelops, itad, operational-upgrade, and mock FacePlane artifacts should be treated as proof lanes and governance simulations, not permission to broaden the product.

6. Documentation And Operating Packages

The May 15 alignment command classified the executive instruction as active context and produced the current documentation packaging plan:

- Trust Binder
- Execution Integrity Appendix
- Operational Runbook
- Demo Reliability Packet
- Pilot Onboarding Kit
- Architecture Diagram Set
- Archive And Hold Ledger

The next practical work is consolidation, not new conceptual writing.

Risks / Gaps

Gap	Severity	Decision
Raw Azure host was not directly reverified in this turn	medium	Use public bridge evidence for today's snapshot; run direct Azure health check when network approval is available
<code>azure/container-app.yaml</code> does not match documented live port posture	medium	Reconcile scaffold YAML against actual Container App export before treating it as deploy-authoritative
Repo has many uncommitted May 15 changes	elevated	Preserve worktree; avoid destructive cleanup; separate snapshot/doc updates from unrelated implementation changes

Gap	Severity	Decision
Expansion pressure from FacePlane and archive materials	elevated	Keep build freeze active; move deferred concepts into Archive And Hold Ledger
Infrastructure docs are split across deployment, system design, architecture index, and release notes	medium	Build Operational Runbook and Trust Binder from existing canonical docs

Immediate Work Order

1. Build the Operational Runbook from deployment, readiness, approval, drift, state anchor, and health-sweep evidence.
2. Reconcile infrastructure truth by exporting the live Container App configuration and comparing it to `azure/container-app.yaml` and `docs/DEPLOYMENT.md`.
3. Build the Trust Binder from product, governance, execution, security, invariant, and surface-plane docs.
4. Keep the demo package locked to the governed deal execution loop.
5. Hold new FacePlane, blockchain, unrelated AI, and major UI expansion until the hardening package is complete.

Verification Run

Commands run for this snapshot:

```
pnpm run check:execution-integrity
pnpm run check:policy
pnpm run check:approval-bottleneck
pnpm run check:faceplane-fork-continuity
pnpm run command:executive-alignment
curl -sS https://nunncorporation.com/api/status
```

Results:

```
check:execution-integrity: passed
check:policy: passed
check:approval-bottleneck: passed
check:faceplane-fork-continuity: passed
```

```
command:executive-alignment: executed, docsScanned=109, auditTrustScore=100  
nunncorporation.com/api/status: connected to non-demo sentinel-api backend, da
```

Direct `curl` to `https://ca-nc-dev-sentinel.calmhill-388e1d39.eastus2.azurecontainerapps.io/health` was not completed in this turn because sandbox DNS failed and the escalated direct check was denied.
