

Responsible, Governed AI for Nuclear Operations — Executive Overview & Pilot Proposal

Company: Nunn Corporation / Nunn Cloud LLC

Problem Statement

Operators and decision-makers in nuclear environments require AI-assisted tools that can accelerate analysis and decision-making while preserving strict authority boundaries, auditability, and evidence trails. Unchecked automation increases operational risk; existing solutions often lack an auditable governance layer that enforces authorization and records rationale.

Our Capability

Nunn Cloud's SSAI platform couples an Executive Desk UX with a governed AI workflow that enforces authority policies, prevents unauthorized actions, and records all decisions and evidence. Key features:

- Policy-driven action gating (rules + human approvals)
- Immutable audit records for decisions and evidence provenance
- Fine-grained operator controls and escalation workflows
- Integration-ready connectors for Cloud-native runtimes (Cloudflare Workers, R2), secure KV, and identity providers
- Small-footprint deployment suitable for constrained operational networks

Proposed Pilot Use Case

A 3-month pilot with the Office of Nuclear Energy to demonstrate:

- **Scenario:** Operator decision support for planned maintenance and anomaly triage
- **Integration points:** telemetry ingestion (read-only), operator console (Executive Desk), and evidence storage (preserved artifacts)
- **Success criteria:** faster triage time vs baseline, 100% auditability of decisions, zero unauthorized actions during the pilot window

Approach & Deliverables (90 days)

- Week 0–2: Requirements & environment discovery (stakeholder interviews, security baseline)
- Week 3–6: Integration, secure testbed deployment, simulated data runs

- Week 7–10: Live operator exercises, monitoring, and evidence capture
- Week 11–12: Final evaluation, documentation of audit evidence, handoff

Data & Security Posture

- Minimal data footprint in pilot; all external calls are controlled and auditable
- Can operate in isolated or partially-connected environments; supports deployment behind existing DOE identity and logging infrastructure
- Evidence preservation and hash chaining for tamper-evident audit records

Engagement & Pricing (high-level)

- Pilot fixed-fee: \$80,000 – \$150,000 (6–12 week pilot, scope-dependent)
- Follow-on integration & development: Time-and-Materials (T&M) — \$150–\$250 per hour depending on resources and security posture
- Support & maintenance retainer: \$5,000 – \$15,000 per month

Note: Pricing is a draft range for scoping and will be refined after the initial discovery phase.

Asks of DOE / Kent

- Introductions to a technical point-of-contact in Office of Nuclear Energy
- Confirmation of allowable pilot data sources and any required security approvals
- Feedback on the proposed success criteria and timeline
- Permission to schedule a 30–60 minute scoping session with program leads

Contact / Next Steps

Proposed: deliver a 1-page technical annex and schedule a scoping call within 7–10 business days.
