

Grid-Responsive Governed AI for Hydroelectric Operations & Regional Resilience

Company: Nunn Corporation / Nunn Cloud LLC

Problem Statement

PMAs and regional authorities manage hydropower and grid resources that require real-time operational decisions balancing supply, grid stability, and environmental constraints. Decision support must be auditable and fit within existing operational authority frameworks.

Value Proposition

- Improve situational awareness and decision speed for dispatch and maintenance events
- Maintain operator authority via policy-driven gates and human-in-the-loop confirmations
- Provide evidence-capture for audit, compliance, and post-event reconstruction

Pilot Use Cases

1. Dispatch decision support during constrained water-flow windows (reduce decision latency)
2. Post-incident forensic reconstruction for regional coordination (complete evidence trail)
3. Executive dashboard for cross-jurisdiction coordination (regional authorities + state energy offices)

Approach

- Rapid scoping with PMA technical leads → 4–8 week pilot demonstrating live dashboard + operator workflow
- Integrations: telemetry (SCADA read-only), communications with dispatch consoles, secure evidence storage
- Success metrics: measured reduction in decision time, demonstrable audit trails, operator acceptance

Why Nunn Cloud

- Experience in governed-AI patterns and low-friction cloud-native deployments

- Proven integration with Cloudflare Workers/Pages for secure edge-hosted UIs and lightweight runtime components
- Policy-first model aligns with regulatory and public-safety expectations

Asks

- Intro to the PMA technical point-of-contact for a short scoping call
- Access to representative telemetry samples and a small test window
- Permission for a limited, non-production pilot exercise
